Frontend Structuring

Session Management

The session management is handed both on the clientside and serverside. There is a maximum limit timer of 10 minutes and 30 seconds, and there are activity checks in intervals (heartbeats) to maintain the user session. On every page load, there are checks to validate the user session and to setup listeners.

Index.html

Index.html will house the login and register screen, it is intended to be the first page the user sees. It will have the username (which would be the email address in this instance) and password entry, all other client details will be editable in the client dashboard. If the user already has a session attached in the server, it will direct the user to the appropriate dashboard.

Dashboards

ClientDashboard.html

There are two separate sections, the **client profile section** and the **flooring projects portal**. The client has different editable fields, their name, email, phone number and password (password is locked and requires entry of old password prior to edit).

There is an **address mini section** which allows the client to **edit their primary address** (as well as the **associated hyperlink** to the flooring project if it exists), as well as a payment method mini section where the user is able to update the credit card information. This mini section will show **alternate secondary addresses** (uneditable but shows a **hyperlink to the associated**), there will be a hyperlink on the secondary address which will allow **swapping of the primary address to a secondary address**.

- The address mini section will be **paginated**.

- OPTIONAL: Can omit this implementation; How to handle multiple clients pointing to the same address? Separate **ClientsAddressAllocation table**, with CLIENTID, ADDRESSID as the composite primary key, with separate edit (same as paying), view, permissions columns; there can be a IsClientsPrimaryAddress derived attribute (or just have this as the main attribute, omitting addressID from the clients table).
    - We would need to change the column name in the flooringProjectRequest
- OPTIONAL: Anna can modify these permissions, a constraint is that there must be at least one client whom can edit and pay.
-

There is a **credit card mini section** that allows the client to edit the credit card information. Clients cannot have more than one credit card.

Flooring Request & Project Section

There are buttons that will allow managing flooring projects at a high level. An address can have multiple flooring project requests on it over time, so each address becomes a collapsible section if there is
There will be a **"Create New Flooring Request"** button, which initially allows the client to either use their primary address or use an alternate secondary address.

- A user cannot have more than 10 pending flooring projects.
- An address cannot have more than 5 pending flooring projects.
- The flooring project request will be **paginated**.

Filtering

There are the **Project ID**, **Service Address**, **Submission Date**, **Project Status**, and **Actions** column.

- The actions columns for now would show [View Details] which would go to the FlooringRequestProject.html

The flooring request section can be filtered in many ways.

- There are **location filters** using either **State** or **City** values

- There are **status filters** using a drop down check list: Pending Review, Quote Ready, Under Negotiation, In Order [Scheduled/In Progress/Completed/Canceled], Billed, Completed

AdminDashboard.html

As aforementioned in the project description, we would need to be able to see at least 10 different diagrams or interactable graphics. There will be the general description and any additional information associated with this as necessary, all results are **paginated**.

1. **Best Customers**: List the clients who have spent the largest total amount on completed and paid flooring projects.
    a. This content will display client name (hyperlinkable), number of completed & paid flooring projects, and the total amount paid

2. **Window Shoppers**: List clients who submitted 3 or more flooring requests but have never accepted a quote. These are clients who repeatedly request estimates without becoming customers.
    a. Nothing else to add here for now

3. **This Month's Flooring Sales**: For a user-specified month and year, list all accepted flooring quotes during that month
    a. Of course, a dropdown selectable month and a numeral input for year is the most valid here.
    b. The columns for this would be the client name & ID (hyperlinkable), flooring project (hyperlinked), accepted date, quoted amount, and scheduled installation date.

4. **Registered but Inactive Clients**: List clients who registered on the website but have never submitted a flooring request.
    a. The columns for this would be the client name, phone number, and ID (hyperlinkable).

5. **Largest Flooring Project**: Find the completed flooring project or projects with the largest total installed square footage.
    a. The columns for this would be the client name (hyperlinkable), flooring project (hyperlinked), total square footage, completion date, and total project price.
    b. If several projects tie for the largest area, display all of them.

6. **Most Popular Flooring Materials**: For each flooring material/product, determine how much flooring has actually been installed. This query should help Anna determine which flooring products are most popular with customers. Products that have never been installed should still be handled appropriately by your system.
    a. Two separate options, flooring products or materials
    b. The columns are as follows: Flooring Products or Materials (descending from largest total installed sq footage to the smallest; hyperlinkable if a flooring product)

7. **Material Cost Analysis**: Find completed projects for which the actual amount of flooring material used exceeded the originally estimated material quantity by at least 10%.

    a. The columns should be as follows: Project (hyperlinkable), primary client name and email (hyperlinkable), estimated quantity, actual quantity, percentage difference, additional material cost.

8. **Overdue Bills**: List all unpaid bills that have been outstanding for more than 7 days.
    a. The columns should be as follows: Client Name & ID (hyperlinkable), bill number (hyperlinkable), bill date, amount due, number of days outstanding.

9. **Problem Customers**: List clients who have had at least two overdue bills and have never paid an overdue bill within 7 days after it became overdue. The query should help Anna identify customers with a repeated history of significantly late payments.
    a. The columns should be as follows: Client Name and ID (hyperlinkable), number of overdue bills, total amount of overdue

10. **Excellent Customers**: List clients who have always paid every bill within 24 hours after the bill was generated. A client must have at least one paid bill to qualify.
    a. The columns should be as follows: Client Name and ID (hyperlinkable), number of bills, total amount paid, average payment time

11. *Client List*: List of clients which shows the following client information,
    a. Columns should be as follows: Client Name, phone number, and ID (hyperlinkable), primary address

12. *Address List*: List of addresses which are hyperlinkable.
    a. Columns should be as follows: Address information (hyperlinkable ID), # of flooring project requests,

Hyperlink Client

This should lead to the ClientDashboard.html, which shows all of the client's associated details except the credit card information and password. It will also show the associated project requests made by the client. The administrator can filter for unpaid bills.

Hyperlink Address

This should lead to some AddressAdminView.html, which shows the address details and all of its associated flooring project requests.

Hyperlink Quote, Bill, Order

Flooring Project Requests, Products
